Bioengineering 280A Principles of Biomedical Imaging

> Fall Quarter 2004 MRI Lecture 1

TT. Liu, BE280A, UCSD Fall 2004

Today's Topics

- The concept of spin
- Precession of magnetic spin
- Relaxation
- Bloch Equation

TT. Liu, BE280A, UCSD Fall 2004

Spin

- Intrinsic angular momentum of elementary particles -- electrons, protons, neutrons.
- Spin is quantized. Key concept in Quantum Mechanics.

The History of Spin

- 1921 Stern and Gerlach observed quantization of magnetic moments of silver atoms
- 1925 Uhlenbeck and Goudsmit introduce the concept of spin for electrons.
- 1933 Stern and Gerlach measure the effect of nuclear spin.
- 1937 Rabi predicts and observes nuclear magnetic resonance.

Quantization of Magnetic Moment

The key finding of the Stern-Gerlach experiment is that the magnetic moment is quantized. That is, it can only take on discrete values.

In the experiment, the finding was that

 $\mu_z = +\mu_0 OR - \mu_0$

TT. Liu, BE280A, UCSD Fall 2004

Quantization of Angular Momentum

Because the magnetic moment is quantized, so is the angular momentum.

In particular, the z-component of the angular momentum Is quantized as follows:

 $S_z = m_s \hbar$

 $m_s \in \{-s, -(s-1), \dots s\}$

s is an integer or half intege

Number of Protons	Number of Neutrons	Spin	Examples
			120, 160
Even	Even	0	¹² C, ¹⁰ O
Even	Odd	j/2	¹⁷ O
Odd	Even	j/2	¹ H, ²³ Na, ³¹ P
Ddd	Odd	j	² H

Nucleus	Spin	Magnetic Moment	γ/(2π) (MHz/ Tesla)	Abundance
¹ H	1/2	2.793	42.58	88 M
²³ Na	3/2	2.216	11.27	80 mM
³¹ P	1/2	1.131	17.25	75 mM

Relaxation

An excitation pulse rotates the magnetization vector away from its equilibrium state (purely longitudinal). The resulting vector has both longitudinal M_z and tranverse M_{xy} components.

Due to thermal interactions, the magnetization will return to its equilibrium state with characteristic time constants.

 $T_1\,$ spin-lattice time constant, return to equilibrium of ${\bf M_z}$

 T_2 spin-spin time constant, return to equilibrium of M_{xy}

T2 Values

Tissue	T ₂ (ms)	
gray matter	100	
white matter	92	
muscle	47	
fat	85	
kidney	58	
liver	43	
CSF	4000	
Table: adapted from Nis	shimura, Table 4.2	
TT. Liu, BE280A, UCSD Fall 2004		

Solids exhibit very short T_2 relaxation times because there are many low frequency interactions between the immobile spins.

On the other hand, liquids show relatively long T_2 values, because the spins are highly mobile and net fields average out.

Free precession about static field

$$\frac{d\mathbf{M}}{dt} = \mathbf{M} \times \gamma \mathbf{B}$$

$$= \gamma \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ M_x & M_y & M_z \\ B_x & B_y & B_z \end{vmatrix}$$

$$= \gamma \begin{pmatrix} \hat{i} (B_z M_y - B_y M_z) \\ -\hat{j} (B_z M_x - B_x M_z) \\ \hat{k} (B_y M_x - B_x M_y) \end{pmatrix}$$
TI LIE, BEEXON, UCDD FAIL 2004

Precession
$M(t) = M(0)e^{-j\omega_0 t}$
$= \left(M_x(0)\cos\omega_0 t + M_y(0)\sin\omega_0 t\right) + j\left(M_y(0)\cos\omega_0 t - M_x(0)\sin\omega_0 t\right)$
In matrix form this is $ \begin{bmatrix} M_x(t) \\ M_y(t) \end{bmatrix} = \begin{bmatrix} \cos \omega_0 t & \sin \omega_0 t \\ -\sin \omega_0 t & \cos \omega_0 t \end{bmatrix} \begin{bmatrix} M_x(0) \\ M_y(0) \end{bmatrix} $
The full solution is then a rotation about the z-axis.
$\begin{bmatrix} M_x(t) \\ M_y(t) \\ M_z(t) \end{bmatrix} = \begin{bmatrix} \cos \omega_0 t & \sin \omega_0 t & 0 \\ -\sin \omega_0 t & \cos \omega_0 t & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} M_x(0) \\ M_y(0) \\ M_z(0) \end{bmatrix}$
$= R_z(\omega_0 t) \begin{bmatrix} M_x(0) \\ M_y(0) \\ M_z(0) \end{bmatrix}$
TT. Liu, BE280A, UCSD Fall 2004
