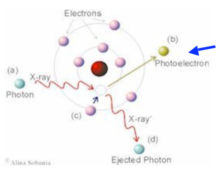
Interaction with Matter

Typical energy range for diagnostic x-rays is below 200 keV. The two most important types of interaction are photoeletric absorption and Compton scattering.



Photoelectric effect dominates at low x-ray energies and high atomic numbers.

Compton scattering dominates at high x-ray energies and low atomic numbers, not much contrast

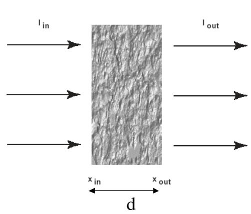
Attenuation



For single-energy x-rays passing through a homogenous object:

$$I_{out} = I_{in} \exp(-\mu d)$$

Linear attenuation coefficient

Attenuation

Adapted from www.cis.rit.edu/class/simg215/xrays.ppt

Half Value Layer

X-ray energy (keV)	HVL, muscle (cm)	HVL Bone (cm)
30	1.8	0.4
50	3.0	1.2
100	3.9	2.3
150	4.5	2.8

In chest radiography, about 90% of x-rays are absorbed by body. Average energy from a tungsten source is 68 keV. However, many lower energy beams are absorbed by tissue, so average energy is higher. This is referred to as beam-hardening, and reduces the contrast.

TT Liu, BE280A, UCSD Fall 2004

Values from Webb 2003

Attenuation

For an inhomogenous object:

$$I_{out} = I_{in} \exp\left(-\int_{x_{in}}^{x_{out}} \mu(x)dx\right)$$

Integrating over energies

$$I_{out} = \int_0^\infty \sigma(E) \exp\left(-\int_{x_{in}}^{x_{out}} \mu(E,x)dx\right) dE$$

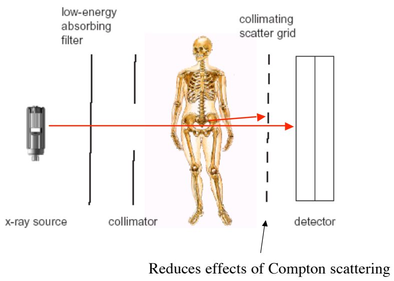
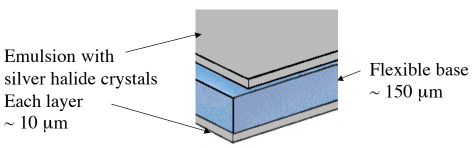
X-Ray Imaging Chain



Suetens 2002

X-ray film



Silver halide crystals absorb optical energy. After development, crystals that have absorbed enough energy are converted to metallic silver and look dark on the screen. Thus, parts in the object that attenuate the x-rays will look brighter.

Direct Inverse Approach

μ_1	μ_2	p_1
μ_3	μ_4	p_2
p_3	p_4	

$p_1 = \mu_1 + \mu_2$
$p_2 = \mu_3 + \mu_4$
$p_3 = \mu_1 + \mu_3$
$p_4 = \mu_2 + \mu_4$

$$\begin{bmatrix} p_1 \\ p_2 \\ p_3 \\ p_4 \end{bmatrix} = \begin{bmatrix} 1 & 1 & 0 & 0 \\ 0 & 0 & 1 & 1 \\ 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mu_1 \\ \mu_2 \\ \mu_3 \\ \mu_4 \end{bmatrix}$$

4 equations, 4 unknowns.
Are these the correct equations to use?

Direct Inverse Approach

μ_1	μ_2	p_1	
μ_3	μ_4	p_2	
p_3	p_4		p_5

$p_1 = \mu_1 + \mu_2$
$p_2 = \mu_3 + \mu_4$
$p_3 = \mu_1 + \mu_3$
$p_5 = \mu_1 + \mu_4$

$$\begin{bmatrix} p_1 \\ p_2 \\ p_3 \\ p_4 \end{bmatrix} = \begin{bmatrix} 1 & 1 & 0 & 0 \\ 0 & 0 & 1 & 1 \\ 1 & 0 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mu_1 \\ \mu_2 \\ \mu_3 \\ \mu_4 \end{bmatrix}$$

4 equations, 4 unknowns. These are linearly independent now.
In general for a NxN image, N^2 unknowns, N^2 equations.
This requires the inversion of a N^2xN^2 matrix
For a high-resolution 512x512 image, N^2=262144 equations.
Requires inversion of a 262144x262144 matrix!
