## Multislice CT

TT Liu, BE280A, UCSD Fall 2005

Siemens 2002

---

---

---

---

---

---

---

---

## Poisson Process

Events occur at random instants of time at an average rate of  $\lambda$  events per second.

Examples: arrival of customers to an ATM, emission of photons from an x-ray source, lightning strikes in a thunderstorm.

Assumptions:

- 1) Probability of more than 1 event in a small time interval is small.
- 2) Probability of event occurring in a given small time interval is independent of another event occurring in other small time intervals.

TT Liu, BE280A, UCSD Fall 2005

---

---

---

---

---

---

---

---

## Poisson Process

$$P[N(t) = k] = \frac{(\lambda t)^k}{k!} \exp(-\lambda t)$$

$\lambda$  = Average rate of events per second  
 $\lambda t$  = Average number of events at time  $t$   
 $\lambda t$  = Variance in number of events

Probability of interarrival times

$$P[T > t] = e^{-\lambda t}$$

TT Liu, BE280A, UCSD Fall 2005

---

---

---

---

---

---

---

---

## Example

A service center receives an average of 15 inquiries per minute. Find the probability that 3 inquiries arrive in the first 10 seconds.

$$\lambda = 15/60 = 0.25$$
$$\lambda t = 0.25(10) = 2.5$$

$$P\{N(t=10) = 3\} = \frac{(2.5)^3}{3!} \exp(-2.5) = .2138$$

TT Liu, BE280A, UCSD Fall 2005

---

---

---

---

---

---

---

---

## Quantum Noise

Fluctuation in the number of photons emitted by the x-ray source and recorded by the detector.

$$P_k = \frac{N_0^k \exp(-N_0)}{k!}$$

$P_k$  : Probability of emitting k photons in a given time interval.

$N_0$  : Average number of photons emitted in that time interval =  $\lambda t$

TT Liu, BE280A, UCSD Fall 2005

---

---

---

---

---

---

---

---

## Transmitted Photons

$$Q_k = \frac{(pN_0)^k \exp(-pN_0)}{k!}$$

$Q_k$  : Probability of k photons making it through object

$N_0$  : Average number of photons emitted in that time interval =  $\lambda t$

$p = \exp(-\int \mu dz)$  = probability of photon being transmitted

TT Liu, BE280A, UCSD Fall 2005

---

---

---

---

---

---

---

---

## Example

Over the diagnostic energy range, the photon density is approximately  $2.5 \times 10^{10}$  photons/cm<sup>2</sup> / R where R stands for roentgen (unit for X-ray exposure).

A typical chest x-ray has an exposure of 50 mR. For transmission in regions devoid of bone,

$$p = \exp(-\int \mu dz) \approx 0.05$$

What are the mean and standard deviation of the number of photons that make it to a 1 mm<sup>2</sup> detector?

$$pN_0 = 0.05 \cdot 2.5 \times 10^{10} \cdot .050 \cdot (.1)^2 = 6.25 \times 10^5 \text{ photons}$$

$$\text{mean} = 6.25 \times 10^5 \text{ photons}$$

$$\text{standard deviation} = \sqrt{6.25 \times 10^5} = 790 \text{ photons}$$

TT Liu, BE280A, UCSD Fall 2005

---

---

---

---

---

---

---

---

---

---

## Contrast and SNR for X-Rays

$$\text{Contrast} = C = \frac{\Delta I}{I}$$

$$\text{SNR} = \frac{\Delta I}{\sigma_I}$$

=  $\frac{\text{Mean difference in \# of photons}}{\text{Standard Deviation of \# photons}}$

$$= \frac{CpN_0}{\sqrt{pN_0}}$$

$$= C\sqrt{pN_0}$$

TT Liu, BE280A, UCSD Fall 2005

---

---

---

---

---

---

---

---

---

---

$$C = \frac{\Delta I}{I} = \frac{N_0 (\exp(-\mu_1 L) - \exp(-(\mu_1(L-W) + \mu_2 W)))}{N_0 \exp(-\mu_1 L)}$$

$$\text{SNR} = \frac{CN_0 A \exp(-\mu_1 L)}{\sqrt{N_0 A \exp(-\mu_1 L)}} = C \sqrt{N_0 A \exp(-\mu_1 L)}$$

TT Liu, BE280A, UCSD Fall 2005

---

---

---

---

---

---

---

---

---

---

## Signal to Noise Ratio for CT

$$SNR = \frac{C\bar{\mu}}{\sigma_p}$$

$$= \frac{C\bar{\mu}}{\sqrt{\frac{T}{MN} \frac{2\pi^2 \rho_0^3}{3}}}$$

$$= 0.4kC\bar{\mu}d^{3/2} \sqrt{MN/T}$$

**C** = contrast  
 **$\bar{\mu}$**  = mean attenuation  
 **$\bar{N}$**  = mean number of transmitted photon  
**T** = spacing between detectors  
**M** = number of views  
 **$\rho_0$**  = bandwidth of Ram - Lak filter =  $k/d$  where  $d$  = width of detector  
**k** = scaling constant, order unity
